

Soil Sample Information Sheet for Surface-Mined Areas

Please Type or Write Legibly (Form expires July 2021)

Use other forms for non-surfaced-mined areas. See other side for sampling instructions. Processing will be delayed if soil is not received in the lab's sample container. For recommendations, be sure to fill in a crop code number. Each sample must have its own form. For more information, go to www.soiltest.vt.edu or contact your local Virginia Cooperative Extension office.

Collecting Soil Samples

Soil samples, improperly taken, often are misleading and can lead to poor germination, seedling growth, and vegetative cover. A sample weighs about one-half pound. A careful job of collecting samples must be done in order for such a small sample to adequately represent several acres of soil. To obtain a representative sample, it is necessary to collect (in a clean plastic bucket) 15 to 20 subsamples of about the same quantity. Depth of sampling should be 4 to 6 inches. A small pick and/or mattox is the best tool for collecting soil samples. The area represented by one sample should not be more than about 5 acres, depending upon uniformity of the soil. In sampling soil, collect subsamples that are more or less uniform in color, rock material, and amount of soil. If you think a certain area will be difficult to revegetate, sample it separately from those adjacent to it. Soil slopes should be sampled separately from bench areas.
